## CLAIMS

- Compressor unit, comprising a centrifugal compressor (1) 1. for compressing a gas and an electric motor (4) having a stator and a rotor (6) for driving the compressor (1), compressor (1) and the electric motor (4) being accommodated in a common gastight housing (7) which is provided with a gas inlet (8) and a gas outlet (9), the stator (5) being accommodated in a separate stator space (21), which is delimited by a wall 10 section, surrounding the stator (5), of the housing (7) of the compressor unit, a gastight partition (22.2) which extends between the stator (5) and the rotor (6) of the electric motor (4), and at least one end wall (22.1) which extends between the partition (22.2) and the housing (7) of the compressor unit, 15 characterized in that the partition (22.2) extends freely between the stator (5) and the rotor (6), of the electric motor (4) and comprises a material of sufficiently high strength for it to remain clear of the stator (5) and the rotor (6) under working pressures of the gas which may occur inside the housing 20 (7).
- 2. Compressor unit according to claim 1, in which the high-strength material of the partition (22.2) comprises a 25 fibre-reinforced plastic (22.3).
  - 3. Compressor unit according to one of the preceding claims, in which the partition (22.2) comprises an erosion-resistant layer (22.4) on the rotor side.
  - 4. Compressor unit according to one of the preceding claims, in which the partition (22.2) comprises a gastight layer (22.4).
- 5. Compressor unit according to one of the preceding claims, 35 in which the partition (22.2) comprises a layer of corrosion-free metal (22.4).

WO 2004/036052 PCT/NL2003/000692

- 12 -

- 6. Compressor unit according to one of claims 1-4, in which the partition (30) comprises a layer of polyaryl ether ketone (40).
- 5 7. Compressor unit according to one of the preceding claims, in which the wall thickness of the partition (22.2) is greater at the ends (22.5, 22.6) than in the middle.
- 8. Compressor unit according to one of the preceding claims,
  10 in which the partition (22.2) and the end wall (22.1) are
  separate parts which are connected to one another in a gastight
  manner by means of one or more sealing rings (22.7).
- 9. Compressor unit according to one of the preceding claims, in which the stator space (21) is provided with connections to a cooling unit for supplying and discharging (23, 24) a cooling medium.
- 10. Compressor unit according to one of the preceding claims,
  20 in which the partition (22.2) comprises a separate inner layer
  (22.4) and outer layer (22.3), on the rotor and stator side,
  respectively, at least the inner layer (22.4) having
  erosion-resistant properties, at least one layer having a high
  strength and at least one layer being gastight.

25

of the outer shell;

- 11. Method for producing a partition (22.2) for a compressor unit according to claim 10, in which the inner layer (22.4) and outer layer (22.3) are produced
- separately, in the form of an inner shell and an outer shell,

  the external diameter of the inner shell, under the same
  pressure and temperature, is larger than the internal diameter
  - the diameter of the outer shell is temporarily increased by means of gas or liquid pressure, and/or
- the diameter of the inner shell is temporarily reduced by lowering the temperature, so that it is possible to push the inner shell into the outer shell, after which the temperature of the inner shell and the pressure are restored.

PCT/NL2003/000692

12. Use of a compressor unit according to one of claims 1-10 for compressing gas.
